A.4.2 Owner can do everything policy

The most fundamental policy in ACME's system is the owner baseline. Each document has exactly one owner, and by default, that owner should be able to perform any action the schema allows on that document. Instead of adding special-case rules throughout the system, ACME encodes this as a single policy. This ensures that no matter how other policies evolve—whether granting view access to customers or layering global constraints—owners always maintain full control of their documents:

```
permit(
  principal is ACME::Employee,
  action in [ ACME::Action::"doc:view",
              ACME::Action::"doc:edit",
              ACME::Action::"doc:share" ],
  resource is ACME::Document
)
when { resource.owner == principal };
```

Recall that we list all the actions to make them explicit and keep the "all" limited to the actions the schema defines for `Document`.

Like before, we can apply the formatting and use the AWS CLI to upload this policy to the policy store:

```
jq -Rs --arg desc "Owner baseline: all actions on owned docs" \
  '{static:{description:$desc,statement:.}}' \
  policy-owner-all.cedar > policy-owner-all.json

aws verifiedpermissions create-policy \
  --policy-store-id $STORE_ID \
  --definition file://policy-owner-all.json
```

You should receive the same type of JSON response you received for the policies regarding viewing documents.
