A.4.3 Employees can share documents that are delegatable

Not every permission at ACME is absolute. Some documents are marked as `delegatable`, meaning the owner can empower others to act on their behalf. Importantly, this doesn't mean anyone can grant access; delegation is tightly scoped. Only employees who are already members of a document's readers team are allowed to share it further, and even then, only if the document has been explicitly flagged as delegatable. This separation between using a document and granting access to it helps ACME maintain strong controls while still supporting collaboration. The following policy enforces that principle:

```
permit(
  principal is ACME::Employee,
  action == ACME::Action::"doc:share",
  resource is ACME::Document
)
when {
  resource.delegatable == true
  && principal in resource.employee_readers_team
};
```

Again, we upload this document by first wrapping it in the proper JSON and then uploading it through the CLI:

```
jq -Rs --arg desc "Employees can share if delegatable" \
   '{static: {description: $desc, statement: .}}' \
   policy-share.cedar > policy-share.json

aws verifiedpermissions create-policy \
  --policy-store-id $STORE_ID \
  --definition file://policy-share.json
```

And the response tells us whether this was successful.

A.4.4 Forbid access from unmanaged devices

So far, our policies have provided access under specific conditions. However, ACME also enforces global constraints that apply across all
