```
    }
]
```

In this simple example, Carol and Dan don’t have managers. Note that we’ve also made Alice on-call.

A.5.2 Customers

Next, we define CustCo employees Kate and Jack. They are the external principals who will access documents in ACME’s Customer Collaboration platform. Separating customers from employees keeps their roles clear in the policies and allows us to show how cross-organizational access is managed:

```
[
  {
      "identifier": { "entityType": "ACME::Customer", "entityId":
"kate" },
      "parents": [
        { "entityType": "ACME::Team", "entityId": "custco-readers"
}
      ]
    },
    {
      "identifier": { "entityType": "ACME::Customer", "entityId":
"jack" },
      "parents": [
        { "entityType": "ACME::Team", "entityId": "custco-readers"
}
      ]
]
```

These are fairly simple because we’re not using any customer attributes in our policies, but a real-life system would likely allow customers to store other profile information as well as internal attributes to guide policies.

A.5.3 Teams

After defining the individuals, we create teams that group them together. Teams make it easier to manage access at scale, since policies can refer to a
