team rather than to each individual member. Here, we have an employee readers team for the Q3 plan document for ACME employees and a CustCo readers team for customers:

```
[
  {
    "identifier": { "entityType": "ACME::Team",
                    "entityId": "doc-q3-employee-readers" },
    "attributes": { "name": "Q3 Plan Employee Readers" }
  }
  {
    "identifier": { "entityType": "ACME::Team", "entityId": "custc
o" },
    "attributes": { "name": "CustCo Readers" }
  }
]
```

Notably, while the employee reader team supports the Q3 plan, the CustCo reader team is not identified as supporting any specific document. This isn’t a security issue, as we’ll see in the next section.

A.5.4 Document

Finally, we define the document itself, the resource to which access decisions will apply. In this example, the Q3 plan is owned by Alice, marked as confidential, and designated as delegatable. Its employee readers are members of the `doc-q3-employee-readers` team, and its customer readers are CustCo employees Kate and Jack:
