- AI is most effective during design-time activities such as drafting, refactoring, and explanation.
- Authorization decisions remain deterministic and are evaluated by a policy engine, not by an AI system.
- Clear intent, narrow scope, and deliberate structure matter more than syntactic elegance.
- Guardrails in prompts and disciplined human review are what make AI assistance safe and useful.
- Final responsibility for authorization behavior always rests with the human author.

For a deeper discussion of why these boundaries matter, see chapter 17. For a contrast with systems that delegate authority to AI agents, see chapter 18.
