- Jupyter Notebook
- the OpenClaw-Cedar demo repository (https://github.com/windley/acme-cedar-demo) checked out locally

The README in the repository will walk you through important steps, such as obtaining your Anthropic key, enabling typed policy evaluation in Cedar, and building OpenClaw.

C.3 Demo 1: reactive authorization

This demonstration shows how authorization is integrated into the agent's execution loop. Rather than calling tools directly, the agent's actions are intercepted and evaluated by a policy enforcement point before execution. This aligns with the policy-aware loop described in section 18.3.

C.3.1 Start the PDP and verify it's working

Start the Cedar PDP server:

```
python3 demo/cedar-pdp-server.py
```

The server loads the Cedar schema, policies, and entities and exposes an endpoint for authorization requests. Leave it running so you can observe decisions in real time. You will see logs of the PDP's actions in the terminal window.

You can verify that the PDP is working by running:

```
python3 demo/test-pdp.py
```

This script runs a small set of test cases against the policy engine. It confirms that the policies are loaded and that basic authorization decisions work as expected. This step checks the plumbing. The real demonstration comes next.
