C.3.2 Run the live agent

Now run the OpenClaw agent with authorization enabled:

```
pnpm openclaw agent --agent main --message "Read the README file in
this repository and summarize it."
```

This starts a real agent session. The agent will:

1. plan a sequence of tool calls
2. attempt to execute those tools
3. have each tool call intercepted by the policy enforcement point
4. receive permit or deny decisions from Cedar

At this point, you are observing the architecture from section 18.3 in action. The expected behavior is as follows:

- The agent selects the read tool
- The PEP constructs an authorization request
- Cedar evaluates the request and returns `permit`
- The tool executes and returns the file contents
- The agent summarizes the result

In the PDP server output, you should see an authorization decision similar to:

```
[Allow] read - Read
```

This shows the normal execution path: the agent proposes an action, policy allows it, and the tool runs.

C.3.3 Observe denied behavior

Now try a prompt that should be denied:
