C.4.1 Start the PDP and verify that query constraints are working

As in the demo in section C.3, you should start the Cedar PDP and leave it running in a terminal window. You can verify that the query constraints API is available by running:

```
python3 demo/test-query-constraints.py
```

This script sends partial authorization requests to Cedar and prints the resulting policy residuals. As in demo 1, this step confirms the system is working. The real demonstration is how the agent uses these constraints.

C.4.2 Run the agent with constraint awareness

Start a live agent session:

```
pnpm openclaw agent --agent main \\
--message "I want to create a file with the content 'Hello World!'.
Please check your authorization constraints first to find out where
you can write files."
```

In this demo, the agent performs an additional step before executing a tool:

1. Agent calls `query_authorization_constraints` with `action: "write"`.
2. Receives residual policies showing `/tmp/*` or `/var/tmp/*` are allowed.
3. Agent presents options to user: "I can write to /tmp or /var/tmp - where would you like the file?"
4. User chooses location like `/tmp/hello.txt`.
5. Agent executes write with content "Hello World!", which succeeds (already knows it's allowed).

Unlike demo 1, the agent may never attempt a disallowed action.

We can also observe the agent discovering file restrictions:
